Time Complexity:

The algorithm repeatedly sorts the nodes in ascending order and merges the two smallest nodes.

Since Bubble Sort is used inside a loop, sorting is done multiple times.

- Best / Average Case = $O(n^3)$
- Worst Case = $O(n^3)$

Space Complexity:

Space is required for storing the Huffman tree and node list.

Recursion is used to generate codes.

- Average Case = $O(n)$
- Worst Case = $O(n)$
